

SPACEX ROCKET LANDING PREDICTIVE ANALYSIS

(DATA SCIENCE AND MACHINE LEARNING CAPSTONE PROJECT)

Several thin, white, parallel lines of varying lengths and slopes are positioned on the right side of the slide, extending from the top right towards the bottom left, creating a sense of motion or trajectory.

EXECUTIVE SUMMARY

In this project, we embarked on a journey through the realm of data science, exploring various methodologies to analyze and derive insights from datasets. Our objective was to delve into the SpaceX Falcon 9 first stage landing prediction, a critical aspect of space exploration and cost optimization in the aerospace industry.

Key Findings:

- Leveraging machine learning algorithms, we successfully predicted the landing outcome of Falcon 9 first stages.
- Our analysis revealed significant cost savings potential by accurately predicting first stage landings.

Methodologies Used:

- Data collection and wrangling
- Exploratory data analysis (EDA) with interactive visual analytics
- Predictive analysis using machine learning algorithms

INTRODUCTION

Our journey began with a clear problem statement: to predict the landing outcome of Falcon 9 first stages. With the rise of reusable rocket technology, accurate landing predictions are crucial for cost-effective space missions. We aimed to explore datasets related to SpaceX Falcon 9 launches and landings to address this challenge.

Three white lines of varying lengths and slopes are positioned in the bottom right corner of the slide, extending from the right edge towards the center.

DATA COLLECTION AND DATA WRANGLING METHODOLOGY

Data Collection:

- We obtained datasets from reliable sources, including SpaceX and NASA, containing information on Falcon 9 launches and landing outcomes.

Data Wrangling:

- We cleaned and preprocessed the data, handling missing values and ensuring data consistency.

Challenges such as inconsistent formatting and data discrepancies were addressed during this phase.

EDA AND INTERACTIVE VISUAL ANALYTICS METHODOLOGY

Exploratory Data Analysis (EDA):

- Utilizing descriptive statistics and data visualization techniques, we gained insights into the characteristics and patterns of Falcon 9 launch and landing data.

Interactive Visual Analytics:

- Leveraging tools like Matplotlib and Seaborn, we created interactive visualizations to explore the data dynamically.
- These visualizations enabled deeper exploration and understanding of the dataset.

PREDICTIVE ANALYSIS METHODOLOGY

Predictive Analysis:

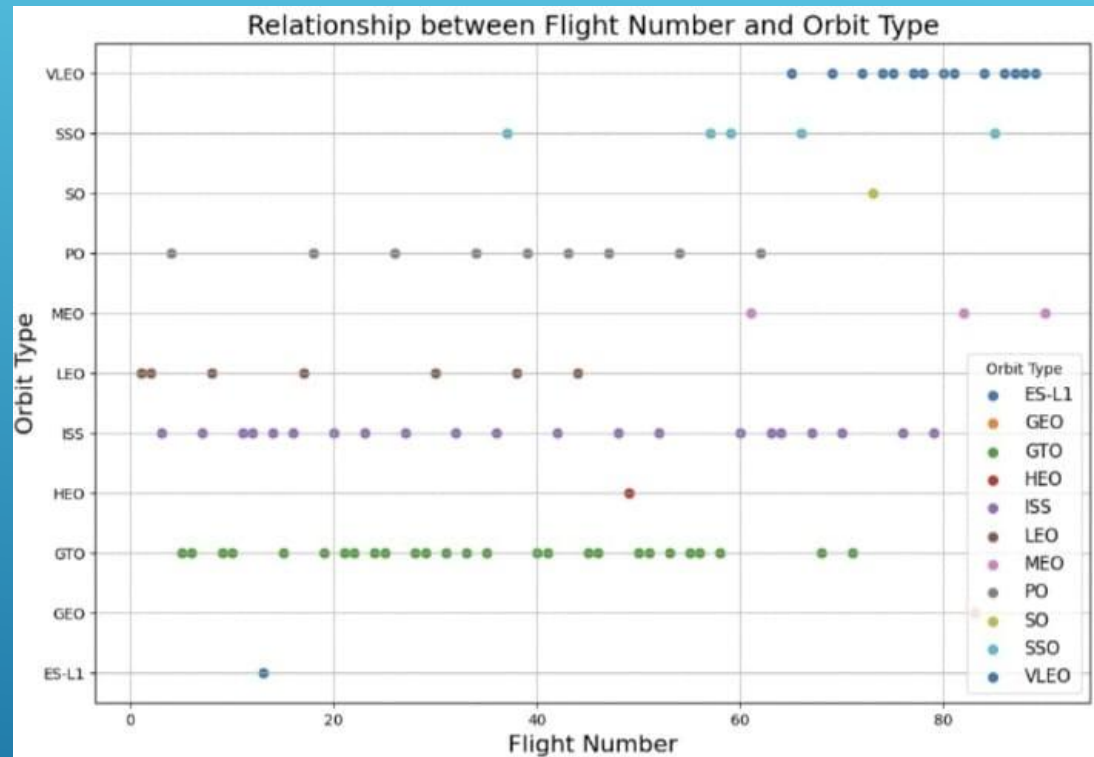

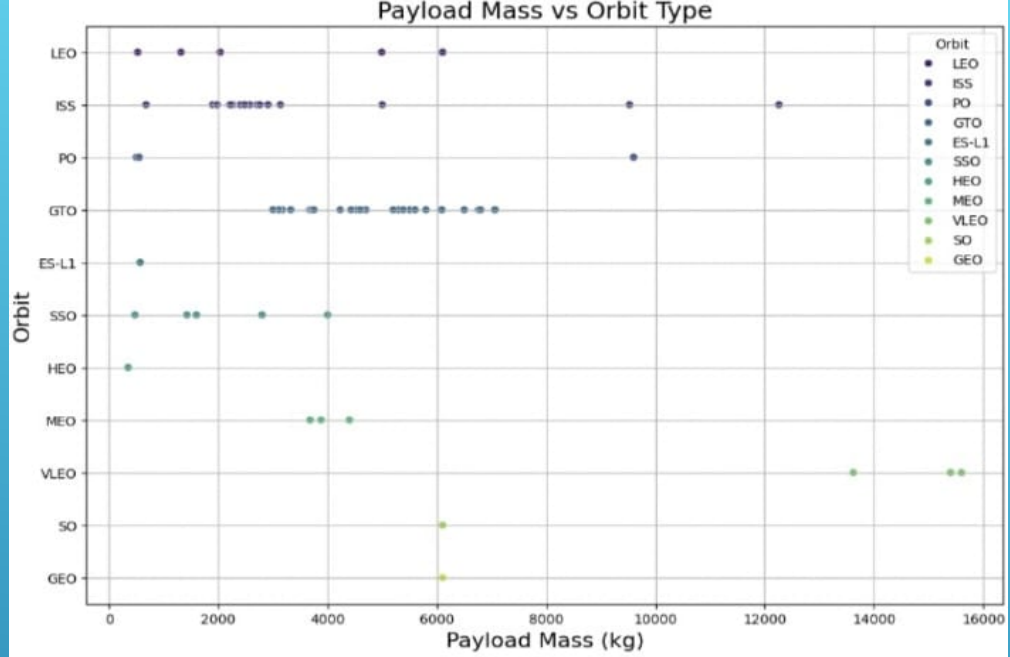

- We applied machine learning algorithms, including logistic regression, support vector machines (SVM), decision trees, and k-nearest neighbors (KNN), to predict Falcon 9 landing outcomes.
- The dataset was split into training and testing sets for model training and evaluation.

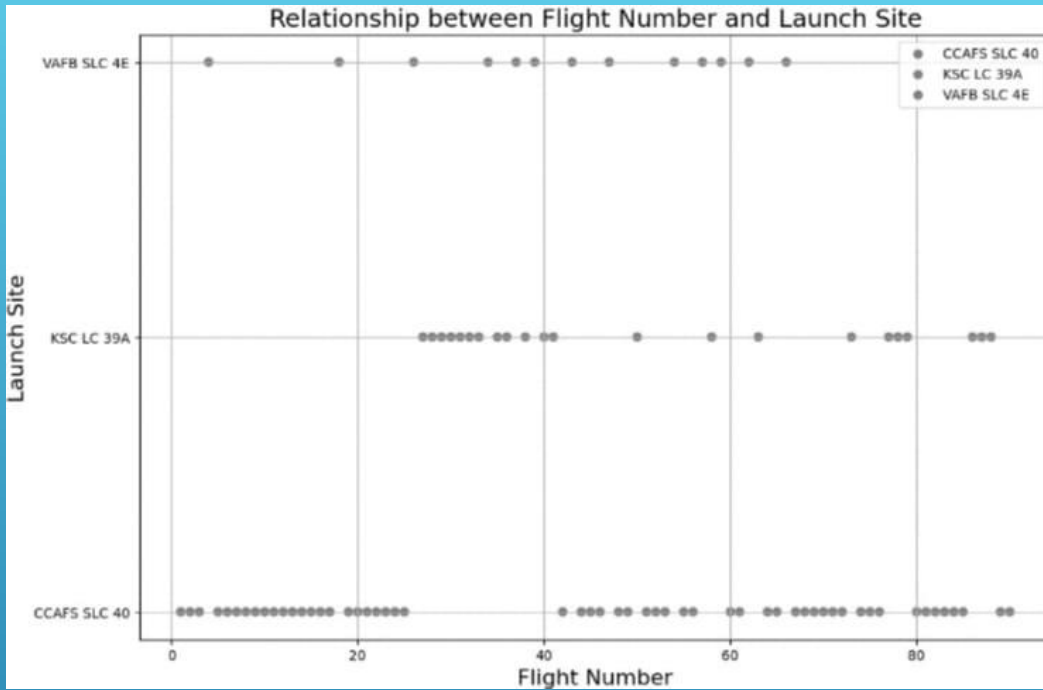

Model Evaluation:

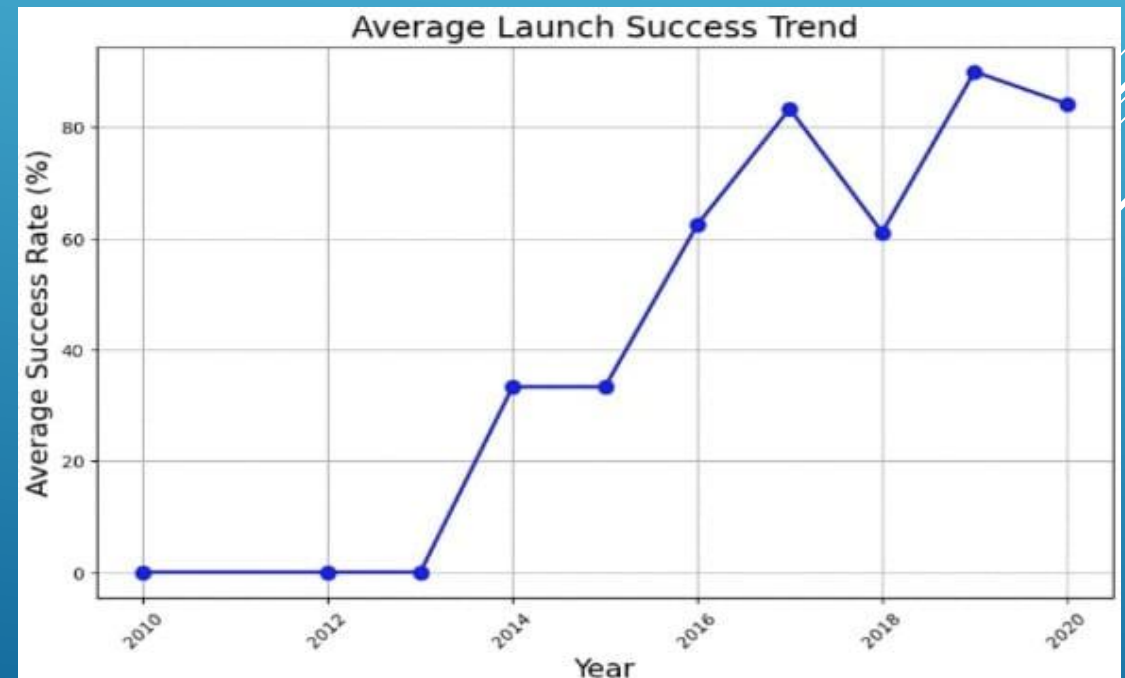

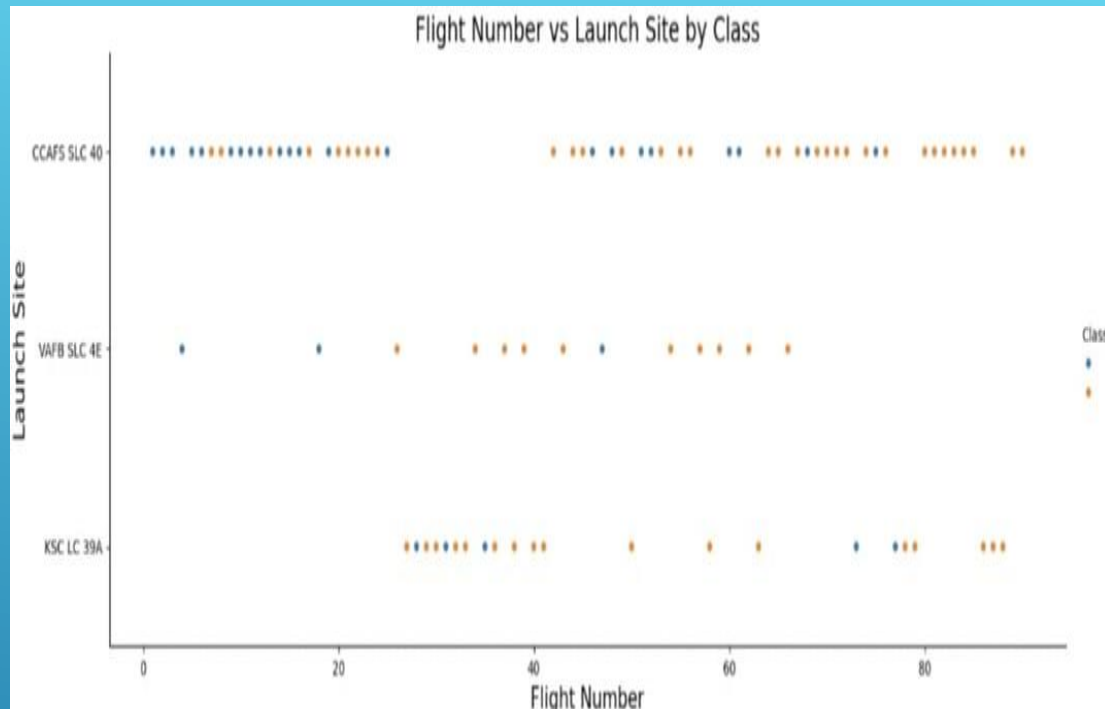

- Performance metrics such as accuracy, precision, recall, and F1 score were used to evaluate the predictive models.

EDA WITH VISUALIZATION RESULTS:

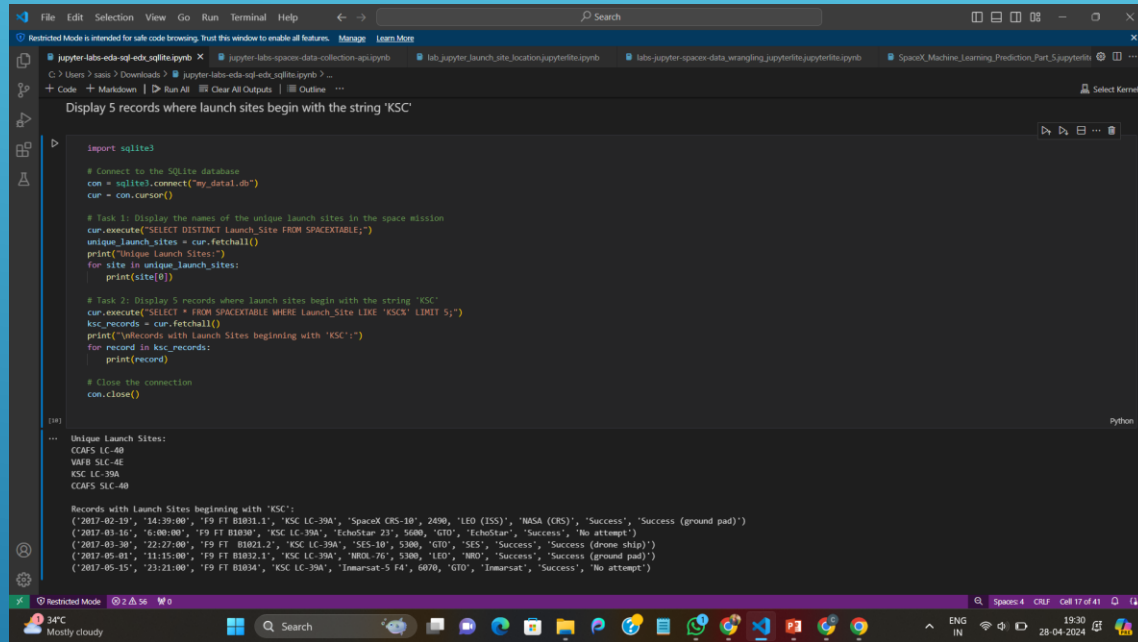

EDA WITH SQL RESULTS:

A Jupyter Notebook window titled "jupyter-labs-eda-sql-edx.sqlite.ipynb" is shown. The notebook is in "Restricted Mode" and contains two tasks. Task 1 is to display the names of the unique launch sites in the space mission. Task 2 is to display 5 records where launch sites begin with the string "KSC". The code uses the sqlite3 module to connect to a database named "my_data.db" and execute SQL queries. The output shows the unique launch sites and the records starting with "KSC".

```
import sqlite3

# Connect to the SQLite database
con = sqlite3.connect("my_data.db")
cur = con.cursor()

# Task 1: Display the names of the unique launch sites in the space mission
cur.execute("SELECT DISTINCT Launch_Site FROM SPACEXTABLE;")
unique_launch_sites = cur.fetchall()
print("Unique Launch Sites:")
for site in unique_launch_sites:
    print(site[0])

# Task 2: Display 5 records where launch sites begin with the string "KSC"
cur.execute("SELECT * FROM SPACEXTABLE WHERE Launch_Site LIKE 'KSC%' LIMIT 5;")
ksc_records = cur.fetchall()
print("\nRecords with Launch Sites beginning with 'KSC':")
for record in ksc_records:
    print(record)

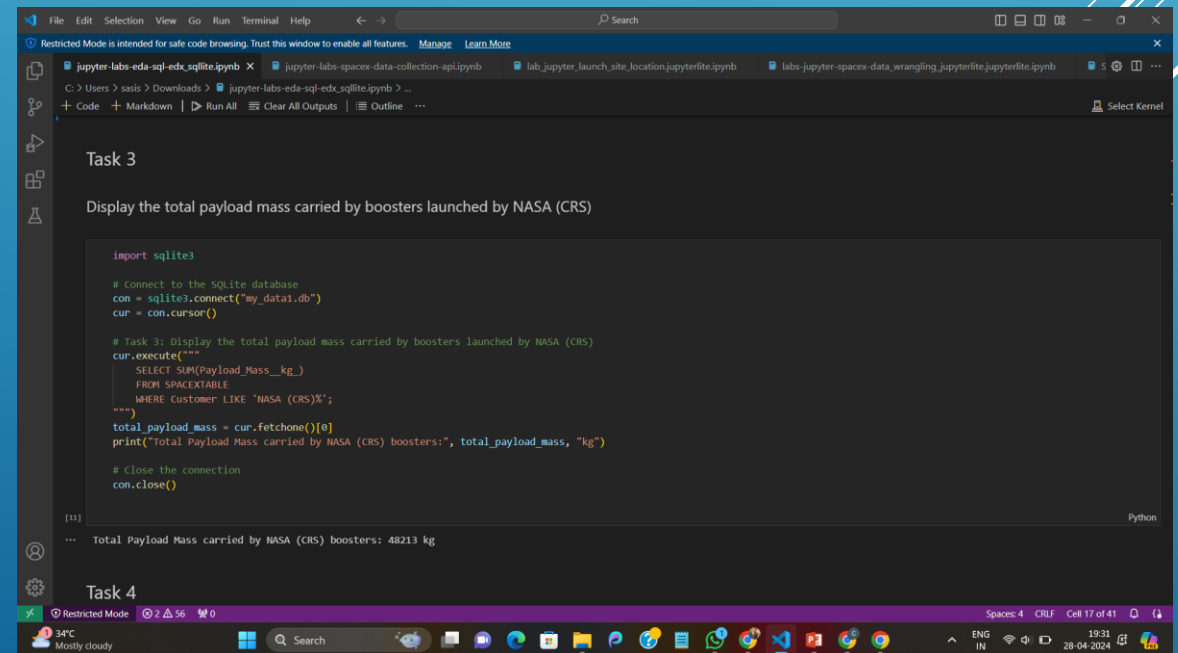

# Close the connection
con.close()
```

Unique Launch Sites:

```
CCAFS LC-40
VAFB SLC-4E
KSC LC-39A
CCAFS SLC-40
```

Records with Launch Sites beginning with "KSC":

```
('2017-02-19', '14:39:00', 'F9 FT B1031.1', 'KSC LC-39A', 'SpaceX CRS-10', '2490', 'LEO (ISS)', 'NASA (CRS)', 'Success', 'Success (ground pad)')
('2017-03-16', '6:00:00', 'F9 FT B1030', 'KSC LC-39A', 'EchoStar 23', '5600', 'GTO', 'EchoStar', 'Success', 'No attempt')
('2017-03-30', '22:27:00', 'F9 FT B1021.2', 'KSC LC-39A', 'SES-10', '5300', 'GTO', 'SES', 'Success', 'Success (drone ship)')
('2017-05-01', '11:15:00', 'F9 FT B1012.1', 'KSC LC-39A', 'MRCO-70', '5300', 'LEO', 'ORCO', 'Success', 'Success (ground pad)')
('2017-05-15', '23:21:00', 'F9 FT B1034', 'KSC LC-39A', 'Inmarsat-5 F4', '6070', 'GTO', 'Inmarsat', 'Success', 'No attempt')
```

A Jupyter Notebook window titled "jupyter-labs-eda-sql-edx.sqlite.ipynb" is shown. The notebook is in "Restricted Mode" and contains two tasks. Task 3 is to display the total payload mass carried by boosters launched by NASA (CRS). Task 4 is to display the total payload mass carried by boosters launched by NASA (CRS). The code uses the sqlite3 module to connect to a database named "my_data.db" and execute SQL queries. The output shows the total payload mass carried by NASA (CRS) boosters.

```
import sqlite3

# Connect to the SQLite database
con = sqlite3.connect("my_data.db")
cur = con.cursor()

# Task 3: Display the total payload mass carried by boosters launched by NASA (CRS)
cur.execute("""
SELECT SUM(Payload_Mass_kg_)
FROM SPACEXTABLE
WHERE Customer LIKE 'NASA (CRS)';
""")
total_payload_mass = cur.fetchone()[0]
print("Total Payload Mass carried by NASA (CRS) boosters:", total_payload_mass, "kg")

# Close the connection
con.close()
```

Total Payload Mass carried by NASA (CRS) boosters: 48213 kg

Task 6

List the names of the boosters which have success in ground pad and have payload mass greater than 4000 but less than 6000

```
import sqlite3

# Connect to the SQLite database
con = sqlite3.connect("my_data1.db")
cur = con.cursor()

# Task: List the names of the boosters with success in ground pad and payload mass between 4000 and 6000 kg
cur.execute("""
SELECT Booster_Version
FROM SPACEXTABLE
WHERE Landing_Outcome = 'Success (ground pad)'
AND Payload_Mass_kg_ > 4000
AND Payload_Mass_kg_ < 6000;
""")
boosters = cur.fetchall()
print("Boosters with success in ground pad and payload mass between 4000 and 6000 kg:")
for booster in boosters:
    print(booster[0])

# Close the connection
con.close()
```

Boosters with success in ground pad and payload mass between 4000 and 6000 kg:
F9 FT B1032.1
F9 B4 B1040.1
F9 B4 B1043.1

Task 7

List the total number of successful and failure mission outcomes

```
import sqlite3

# Connect to the SQLite database
con = sqlite3.connect("my_data1.db")
cur = con.cursor()

# Task: List the total number of successful and failed mission outcomes
cur.execute("""
SELECT Mission_Outcome, COUNT(*)
FROM SPACEXTABLE
GROUP BY Mission_Outcome;
""")
mission_outcomes = cur.fetchall()
print("Total number of successful and failed mission outcomes:")
for outcome, count in mission_outcomes:
    print(outcome, ":", count)

# Close the connection
con.close()
```

Total number of successful and failed mission outcomes:
Failure (in flight) : 1
Success : 98
Success : 1
Success (payload status unclear) : 1

Task 9

List the records which will display the month names, successful landing_outcomes in ground pad, booster versions, launch_site for the months in year 2017

Note: SQLite does not support monthnames. So you need to use substr(Date,6,2) for month, substr(Date,9,2) for date, substr(Date,0,5), ''2017' for year.

```
import sqlite3

# Connect to the SQLite database
con = sqlite3.connect("my_data.db")
cur = con.cursor()

# Task9: List the records for successful landing outcomes in ground pad, booster versions, and launch sites for the months in year 2017
cur.execute("""
SELECT
    substr(Date, 6, 2) AS Month,
    Landing_Outcome,
    Booster_Version,
    Launch_Site
FROM
    SPACEXTABLE
WHERE
    substr(Date, 8, 5) = '2017' AND
    Landing_Outcome = 'Success (ground pad)'
""")
records_2017 = cur.fetchall()
print("Records for successful landing outcomes in ground pad, booster versions, and launch sites for the months in year 2017:")
for record in records_2017:
    print(record)

# Close the connection
con.close()
```

[17] Python

Records for successful landing outcomes in ground pad, booster versions, and launch sites for the months in year 2017:
(('02', 'Success (ground pad)', 'F9 FT B1032.1', 'KSC LC-39A'))
(('05', 'Success (ground pad)', 'F9 FT B1032.1', 'KSC LC-39A'))
(('06', 'Success (ground pad)', 'F9 FT B1035.1', 'KSC LC-39A'))

CONCLUSION:

In conclusion, the project demonstrated the power of geospatial visualization techniques in analyzing and understanding complex spatial data related to space launch operations. The insights gained from this analysis contribute to ongoing efforts in advancing space exploration and technology development. Our analysis revealed significant cost savings potential by accurately predicting first stage landings.

Several thin, white, parallel diagonal lines are positioned in the bottom right corner of the slide, extending from the right edge towards the center.
